

Ghost AI Studio

AI THAT UNDERSTANDS INTEGRATION

NOT JUST THE TEXT AROUND IT.

Ghost AI Studio is an AI workspace for understanding, creating and improving integrations — from existing enterprise platforms to new Ghost Nodes architectures.

It doesn't just describe integrations. It works with them.

UNDERSTAND

Analyse BizTalk, SnapLogic and CIS/TEIS integrations — including flows, components, dependencies and logic.

CREATE

Describe what you need. AI Studio creates the corresponding Ghost graph.

BUILD

Create new Ghost adapters through prompting when something is missing.

WHAT AI STUDIO CAN DO

DOCUMENT

Turn existing or newly created Ghost graphs into technical documentation.

OPTIMIZE

Analyse and improve Ghost graphs for structure, execution and maintainability.

MIGRATE

Use existing integration logic as input when moving from legacy platforms to Ghost Nodes.

UNDERSTAND FIRST. MIGRATE SECOND.

AI Studio can analyse integration artefacts — including BizTalk MSI packages and .NET assemblies — to understand how an existing integration works.

Not blind 1:1 conversion

Understand the existing logic and dependencies. Then build the right architecture in Ghost.

Because “just rebuild it” is rarely a migration strategy.

What this changes

- Less reverse engineering
- Faster migration and development
- Better documentation
- Less dependency on individual specialists

AI built for distributed integration

Cloud • On-premises • Private infrastructure • Edge • Isolated environments.
Use cloud-based or local AI models depending on your requirements.
